

SOLUTION BRIEF

# Back Up to Google Cloud

Improve your data resiliency and recoverability.

Retire legacy backup hardware and tape.

Simplify operations.

## STREAMLINE BACKUP & RECOVERY OPERATIONS WITH GOOGLE CLOUD PLATFORM (GCP)

GCP and Commvault® Cloud create a compelling reason to move your backup to the cloud. Migration is simple with Commvault Cloud's native GCP integration. Commvault Cloud enterprise-grade GCP backup and recovery helps keep your data secure, compliant, and rapidly recoverable from cyberthreats and data loss. Simplify your backup process while reducing costs and improving reliability.

## MOVE AND MANAGE YOUR DATA ACROSS ALL GCP STORAGE

Easily move your data to GCP Standard, Nearline, Coldline, and Archive storage containers, depending on your needs. Native integration eliminates the need for cloud connectors and speeds migration.

## DON'T REFRESH ANOTHER TAPE LIBRARY, REPLACE IT

Cloud is the new tape. Eliminate tape libraries, transportation logistics, and third-party records companies. Spend less time in your datacenter. GCP and Commvault Cloud frees up resources and brings agility and scale to your backup and recovery operations - all while improving reliability and availability.

## AVOID THAT NEXT STORAGE HARDWARE REFRESH OR FORKLIFT UPGRADE

Stop the endless cycle of maintaining and refreshing backup hardware. No more large capital expenses as hardware reaches end of life. GCP provides flexibility and scale in a consumption-based model, and Commvault Cloud deduplication helps that bottom line even more.

## PROTECT AGAINST RANSOMWARE AND OTHER THREATS

Keep your backups air-gapped and safe from ransomware and other threats. GCP storage containers with Bucket Lock offers write-once (WORM), immutable storage to meet your compliance standards and ensure your data's integrity while offering instantaneous access for quick restores.

No appliances  
or gateways  
needed

Direct to GCP  
with no hassles

All GCP storage  
supported  
natively

## SIMPLIFY YOUR DATA BACKUP TO GOOGLE CLOUD PLATFORM (GCP)

From a single interface, Commvault Cloud delivers comprehensive capabilities including backup and recovery, archive, eDiscovery and ransomware protection. Integration with Google Cloud storage means that you set the backup policies and Commvault Cloud does the rest. With GCP and Commvault Cloud, you'll have the confidence of knowing that all your workloads and applications are secured and recoverable.

Commvault Cloud's unmatched workload coverage includes:

<b>25+</b> applications/ databases	<b>30+</b> storage arrays & storage types	<b>15+</b> hypervisor & container platforms
<b>20+</b> operating environments	<b>40+</b> cloud options	<b>SaaS</b> and cloud native applications

**"It can take minutes to begin restoring data now with GCP and Commvault where it used to take hours to get access to offsite backups."**

**Kelly Robinson**

Director of Enterprise Infrastructure, Instructional Innovation and Technology  
Georgia State University

## WHY MAKE THE MOVE TO GOOGLE CLOUD PLATFORM AND COMMVAULT CLOUD?

- One platform to manage all of your backup requirements. Remove point solutions that drive up costs—gain a single view into all data. Easily move your data to GCP Standard, Nearline, Coldline, and Archive storage containers, depending on your needs.
- Commvault Cloud's native integration works seamlessly with GCP and eliminates the need for cloud connectors and gateways.
- Eliminate unreliable and fragile physical tape. Can you really depend on "the truck" to protect your data?
- Save hours and hours of administrative time. Automation and orchestration eliminate manual tasks.
- Free yourself from legacy hardware lock-in. Avoid the high cost of forklift upgrades and continual hardware purchases.
- Commvault cyber resilient ransomware protection improves threat and risk mitigation with foundation and application hardening, pre-emptive alerts, incident remediation and reporting. AI driven analytics provide greater confidence in data backup, recovery, and compliance.
- Google Bucket Lock enables air-gapped, write-once (WORM) storage to meet the most stringent compliance requirements.
- Policy-driven backup of G Suite and Google Drive.
