

APPLICATION MODERNIZATION

# Safeguarding Mission-Critical Data

## Modernize Data Protection With a Single, Scalable Solution

Modernizing mission-critical applications makes good business sense. But for most organizations, these applications are complicated, costly and even impossible to refactor for the cloud. Large-scale databases and platforms like SAP HANA, Oracle or SQL Server usually need expert support to ensure the movement to, from and between clouds is reliable, secure and always protected.

To ensure application modernization initiatives continue as planned, Commvault partners with Global System Integrators (GSIs) to help enterprises reduce the risks of cloud migration and application modernization – particularly as cyberthreats have evolved. Our data protection services, managed through a single console, reign in the complexity of protecting and managing vital data in hybrid and multi-cloud environments while supporting interoperability aims and reducing costs.

## Application Modernization Challenges

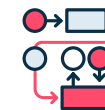

Outdated technology and data management practices

Inefficient and costly backup plans

Data sprawl and lack of visibility across environments raise cyberthreat risks

Manual and siloed processes that can't effectively scale

## Application Modernization Relies on Agility

Partnering with GSIs, Commvault helps customers accelerate application modernization while establishing a future-proof, scalable solution for unified data protection and recovery.

Our solutions protect mission-critical, high-performance workloads and mainframes — and offer full portability of data to seamlessly support refactoring to cloud-based offerings. We meet customers wherever they are in their cloud journey and have long-standing alliances with cloud providers and software service providers to ensure seamless integration of workloads to any cloud.

### Commvault Data Protection Benefits

- Re-host applications to your cloud of choice without altering architecture
- Flexible out-of-place recovery options for fast incident response and less downtime
- Ensure applications stay protected while moving to cloud-native options
- Enhance application portability and resilience with orchestrated recovery

## Commvault Helps GSI Partners Deliver More Value to Customers\*

**60%**

Reduction in annual exposure to data theft or breaches

**50%**

Reduction in annual unplanned downtime

**78%**

Net cost reduction per TB for IT staff data management support

**30%**

Improvement in average recovery time for VMs
