Digital Transformation Changes Everything When It Comes to Data

It's hard to put your data to work for customers and innovation when it's scattered across silos, clouds, and on-premises storage – all managed with different backup and recovery products. Organizations need to have a modern data protection strategy that drives security across their whole environment, unifying the generations of data and workloads scattered across the data center. Having unmatched security and flexibility to seamlessly move workloads across the IT environment allows organizations to modernize, scale, and protect their data. **That's business agility.**

Cloud Transformation Is Digital Transformation

Organizations are rapidly developing and accelerating their digital transformation journey to manage ongoing change – externally and internally. Digital transformation efforts may involve cloud migration, SaaS adoption, and application modernization. No matter where they are in their journey, organizations still need to embrace agility so they can quickly adapt to market demands and respond rapidly to interruptions, all while remaining customer centric.

Our Intelligent Data Services include the industry's broadest support for cloud, on-prem, SaaS, virtual, physical, applications, and more data sets under a single solution and common infrastructure. With Commvault, you can quickly adopt new technologies and eliminate redundancy.

By 2024, **over 50% of all IT spending** (up from 31% in 2018) will be directly for digital transformation and innovation, in total accounting for nearly $7.1 trillion.[1]

Two Degrees Cuts Storage Needs and Total Cost of Ownership

BACKGROUND

Two Degrees Mobile Limited (2degrees) is a full-service tele communications provider in New Zealand. Today, its mobile network covers 98% of the places Kiwis live and work. With more than one million customers, a 1,200-strong team, and 55 retail outlets throughout New Zealand, 2degrees collects and stores an enormous amount of data – 380 terabytes, to be exact – which often contains sensitive and private corporate and customer information.

CHALLENGE

2degrees sought to modernize its data protection and management infrastructure to support the fast-growing business and meet its data demands. Previously, 2degrees used Commvault software with scale-up hardware to protect its critical customer information, such as mobile billing and usage data. However, it was time-consuming and complex to manage the data with the aging hardware and increasingly difficult to scale to meet the business' needs.

SOLUTION

While already using Commvault's data protection solutions, 2degrees recognized the need for a more holistic approach to its data management strategy. By adopting Commvault HyperScale Software with Hewlett Packard Enterprise's (HPE) high-density Apollo storage, 2degrees has lowered administration overheads and optimized the existing hardware to reduce costs. 2degress has also benefited from Commvault Command Center, a centralized, easy-to-use management and reporting dashboard, and the support team for troubleshooting.

> *Thanks to Commvault HyperScale Software, we can now support hybrid environments – on-premise and the cloud – significantly reducing the complexity of our data protection environment. The solution also allows us to use data more effectively and supports our data management strategy. This is important as the business transforms to meet the needs of operating in the digital age.*
